Total	**12.93**	**71,249.42**	**921,555.38**

OT vs. Hire Ratio by Job Title

Question: For which roles is overtime costing more than a new hire would?

Practice Model: About This Dashboard

What it is: This is a self-built practice model created to demonstrate data reconciliation, dashboard design, and root-cause analysis using Power BI and DAX, focused specifically on statewide overtime management. A fictional dataset structured to mirror how overtime, staffing, and budget data would realistically be tracked including position-level payroll detail, budget-versus-actual tracking, and staffing vacancy data across a mix of 24/7 coverage agencies and standard business-hours agencies. All agency names, employee IDs, and dollar amounts are randomly generated, no real employee, payroll, or agency data is used anywhere in this model.

How to Navigate This Dashboard

- Cost & Budget Overview - is overtime a budgeting/staffing issue or an overspend/discipline issue, and has that answer been consistent year over year?
- Overtime Cost by Agency - which agencies are driving the majority of overtime spend?
- Overtime Detail - who and what is actually driving the cost: concentration among top earners, by job title, and mandated vs. voluntary by shift
- Relationship Between Vacancy and Overtime Spend - does staffing vacancy correlate with overtime cost, tested at the individual department level
- Reason Code - what's documented as driving overtime for 24/7 agencies, and how much goes undocumented
- Seasonality - is overtime a predictable seasonal pattern, a chronic year-round pattern, or a sharp short-window spike, and does the answer differ by department
- Cost Avoidance - for which job titles would hiring an additional FTE cost less than the overtime already being paid

How Key Figures Are Calculated

- OT Budget Variance %: (Total Actual OT − Total Budgeted OT) ÷ Total Budgeted OT
- OT Variance % (All Years) by Fiscal Year: Same calculation as OT Budget Variance %, shown side by side for FY2025 and FY2026 regardless of the Fiscal Year slicer, to test whether the variance is a recurring pattern or a one-year anomaly
- Avg Vacancy Rate: (Budgeted Positions − Filled Positions) ÷ Budgeted Positions, averaged by quarter and department
- Vacancy OT Correlation: Pearson correlation coefficient between department-level Avg Vacancy Rate and Total OT Cost
- Mandated OT %: Mandated OT Cost ÷ Total OT Cost (24/7 Coverage agencies only)
- Reason Code Fill Rate: Rows with a documented reason code ÷ Total OT rows
- Top 20% Concentration %: OT cost from the top 20% of Front-Line Coverage employees (by individual OT cost) ÷ Total Front-Line Coverage OT cost
- OT vs Hire Ratio: Total OT Cost for a job title ÷ Est. Annual FTE Cost (avg. hourly rate × 2,080 hours × 1.35 fringe factor)

Assumptions

- The 1.35 fringe benefit multiplier is an approximation, not tied to a specific real fringe rate table. A real analysis would use the agency's actual fringe rate.
- This model uses two fiscal years of data (FY2025, FY2026) rather than a longer history, to keep the position-level and pay-period-level detail manageable while still showing a real seasonal pattern.
